PRESCRIBED MEDICATION

Ozempic (semaglutide) injection

0.25 mg/dose pen injector — 1.5 mL prefilled pen

Sig: Inject 0.25 mg subcutaneously once weekly x 4 weeks, then increase to 0.5 mg subcutaneously once weekly.

Dispense: 1 pen (4-week supply at 0.25 mg)

Refills: 5 (subject to prior authorization approval)

Route: Subcutaneous injection (abdomen, thigh, or upper arm)

CLINICAL JUSTIFICATION FOR PRIOR AUTHORIZATION

Indication: Type 2 Diabetes Mellitus (ICD-10: E11.9, E11.65) — uncontrolled.

Previous Therapies Tried and Failed:

- Metformin HCl 1000mg twice daily — 18 months — inadequate glycemic control
- Structured dietary counseling and lifestyle modification — 12 months — inadequate response

Current Lab Values Supporting Medical Necessity:

- HbA1c: 8.9% (target < 7.0%) — collected 05/10/2025
- Fasting glucose: 187 mg/dL (normal 70–99 mg/dL) — collected 05/10/2025
- eGFR: 72 mL/min/1.73m2 — no renal contraindication to semaglutide

Clinical Rationale: Patient has failed first-line oral therapy after 18 months of maximum-dose Metformin with documented adherence. GLP-1 receptor agonist therapy is indicated per ADA Standards of Care 2025 for patients with T2DM failing metformin monotherapy, particularly those with elevated cardiovascular risk factors (hypertension, dyslipidemia). Ozempic (semaglutide) is preferred for its demonstrated HbA1c reduction (1.5–1.8%) and cardiovascular benefit profile.
